

- **Anyone** who needs assistance can signal and get help.
- **Teachers** can get assistance without picking up the phone.
- Additional help can be requested if **a patient, resident or client** needs it.
- Updating **management** about housekeeping staff creates a better & safer work environment.

Staff Alert 911 is cloud software service with on-site links that uses cellular service or wireless access to enhance communications for routine or unexpected events.

- Shake a cell phone to trigger an alert
- Managers receive a unique audio alert tone that overrides the silent mode so that they can react quickly
- In hotels it can integrate with any Property Management System; reporting on housekeeping staff progress and room status (clean, needing maintenance and so forth)
- In school's teachers and aids can get assistance even if they are separated from the phone. (we use Bluetooth or wireless triggers)
- Any business can use the **Staff Alert 911** for unexpected events that need prompt attention

We combine cellular apps with cloud services to provide enhanced internal and external communications. We integrate with Property Management Systems, phone, fire and security systems to expand features as needed. For example, we can report on 911 calls and deliver location information to management real-time. We can generate real-time data for room status reports in hospitality environments.

Step by step with StaffAlert911:

1. Calls for help are triggered by a mobile application or with the wireless AWS button.
2. This alert is picked up by a wireless access point or cellular service.
3. The data is transferred to the **StaffAlert911** cloud server
4. Our Cloud Application reads the data for customer identity, location and alert type
5. The Application identifies the target list of managers to be informed and forms the detailed voice, text and email message.
6. And then, sends the message to the target list for action
7. Finally, the service sends a report about the alert that was sent.

Easier

- Download the application, watch the video of how to load the signal information
- Order the number AWS buttons needed – they are preprogrammed
- Upload the staff contact group or groups

Faster

- Alert to communications is moments not minutes
- Alert staff in multiple ways (text, email, audio message) at the same time
- With multiple staff getting multiple messages – response times are faster and assured

Better

- Better response times and better feedback
- We can build on these packages and integrate the system with fire and security systems
- We can also add phone systems and external paging systems with informational tones or announcements
